## TOPIC 33—INJECTIONS, SURJECTIONS AND BIJECTIONS

Demirbaş & Rechnitzer

# INJECTIONS, SURJECTIONS AND BIJECTIONS

# INJECTIONS — DIFFERENT MAPS TO DIFFERENT

## DEFINITION:

Let  $f : A \rightarrow B$  be a function.

The function  $f$  is **injective** when for all  $a_1, a_2 \in A$

$$(a_1 \neq a_2) \implies f(a_1) \neq f(a_2)$$

Equivalently (by the contrapositive)

$$f(a_1) = f(a_2) \implies a_1 = a_2$$

**Injections** are also called **one-to-one** functions.

Note: if  $f$  is injective then for every  $b \in B$ ,  $|f^{-1}(\{b\})| \leq 1$ .

This is consistent with  $|A| \leq |B|$

# INJECTION EXAMPLE

## PROPOSITION:

The function  $f : \mathbb{R} \rightarrow \mathbb{R}$  defined by  $f(x) = 7x - 3$  is injective

Use  $f(a_1) = f(a_2) \implies a_1 = a_2$  to prove — equalities easier than inequalities.

## PROOF.

Let  $x, z \in \mathbb{R}$  and assume that  $f(x) = f(z)$ . Then we know that

$$7x - 3 = 7z - 3$$

$$7x = 7z$$

$$x = z$$

and hence the function is injective.

# SURJECTIONS — EVERYTHING IS MAPPED TO BY SOMETHING

## DEFINITION:

Let  $g : A \rightarrow B$  be a function.

The function  $g$  is **surjective** when

$$\forall b \in B, \exists a \in A \text{ s.t. } g(a) = b$$

**Surjections** are also called **onto** functions.

Note: if  $g$  is surjective then for every  $b \in B$ ,  $|g^{-1}(\{b\})| \geq 1$ .

This is consistent with  $|A| \geq |B|$

# SURJECTION EXAMPLE

## PROPOSITION:

The function  $f : \mathbb{R} \rightarrow \mathbb{R}$  defined by  $f(x) = 7x - 3$  is surjective

Given  $y \in \mathbb{R}$ , we need to find  $x \in \mathbb{R}$  so that  $f(x) = y$ :

$$y = 7x - 3 \quad \text{so} \quad y + 3 = 7x \quad \text{so} \quad x = \frac{y + 3}{7}.$$

## PROOF.

Let  $y \in \mathbb{R}$  and set  $x = \frac{y+3}{7} \in \mathbb{R}$ . Then

$$f(x) = 7x - 3 = 7 \cdot \frac{y + 3}{7} - 3 = y + 3 - 3 = y$$

as required. Hence the function is surjective.

# A NON-EXAMPLE

## PROPOSITION:

The function  $f : \mathbb{R} \rightarrow \mathbb{R}$  defined by  $f(x) = x^2$  is neither injective nor surjective.

not injective  $\equiv \exists x_1, x_2 \in A$  s.t.  $(x_1 \neq x_2) \wedge (f(x_1) = f(x_2))$

not surjective  $\equiv \exists b \in B$  s.t.  $\forall a \in A, f(a) \neq b$

## PROOF.

We prove each claim in turn.

- Now let  $x = 1, z = -1$ . Then since  $f(x) = 1 = f(z)$ , the function is not an injection.
- Let  $y = -1$ . For any  $x \in \mathbb{R}$  we know  $f(x) = x^2 \geq 0$ , so there is no  $x \in \mathbb{R}$  so that  $f(x) = y$ . So  $f$  is not a surjection.

# BIJECTIONS — INJECTIVE AND SURJECTIVE

## DEFINITION:

Let  $h : A \rightarrow B$  be a function. The function  $h$  is **bijjective** when it is both injective and surjective.

**Bijections** are also called **one-to-one correspondences**.

Note: if  $h$  is bijective then

- since  $h$  is injective we know that for every  $b \in B$ ,  $|h^{-1}(\{b\})| \leq 1$
  - since  $h$  is surjective we know that for every  $b \in B$ ,  $|h^{-1}(\{b\})| \geq 1$
- and so for every  $b \in B$ ,  $|h^{-1}(\{b\})| = 1$ .

This is consistent with  $|A| = |B|$

From work above  $f : \mathbb{R} \rightarrow \mathbb{R}$  defined by  $f(x) = 7x - 3$  is bijective.

## ANOTHER $x^2$ EXAMPLE

Consider the 4 functions

$f : \mathbb{R} \rightarrow \mathbb{R}$	$f(x) = x^2$
$g : \mathbb{R} \rightarrow [0, \infty)$	$g(x) = x^2$
$h : [0, \infty) \rightarrow \mathbb{R}$	$g(x) = x^2$
$\rho : [0, \infty) \rightarrow [0, \infty)$	$\rho(x) = x^2$

Then

- $f$  is neither injective nor surjective
- $g$  is surjective but not injective
- $h$  is injective but not surjective
- $\rho$  is both injective and surjective

Let's prove the last one carefully.

# INJECTIVE AND SURJECTIVE

$\rho : [0, \infty) \rightarrow [0, \infty)$  with  $\rho(x) = x^2$  is injective and surjective

## PROOF.

We prove each in turn.

- Injection: Let  $x, z \in [0, \infty)$  with  $\rho(x) = \rho(z)$ . Then we know that  $x^2 = z^2$  and hence  $x = \pm z$ . But since  $x, z \geq 0$  we must have  $x = z$  as required.
- Surjection: Let  $y \geq 0$  and then set  $x = \sqrt{y}$ . Since  $y \geq 0$ , we know that  $x \in \mathbb{R}$ . Then  $\rho(x) = x^2 = (\sqrt{y})^2 = y$ .
